THREE STEPS AFTER PRK

1. Step One- Use your eye drops.
   ✓ Get 4 sets of medicated eye drops in before bedtime, one as soon as you get home, then again after a MANDATORY two hour nap, then evening, then bedtime.
   ✓ FML or Alrex (steroid)– use 4 times daily for the first week, 3 times daily for the second week, 2 times daily the third week, and once daily final week
   ✓ Zymaxid(gatifloxacin)/Vigamox (antibiotic) – 4 times daily, stop after one week
   ✓ Ketorolac (anti-inflammatory)– use 4 times daily, stop after 3-4 days
   ✓ Use only non-preserved tears in INDIVIDUAL DROPPERS every hour the first week, then 4 times through the next 10 weeks. Approved list: Refresh, Refresh Plus, Refresh Optive, Systane Ultra, or Theratears. DO NOT use Refresh Optive ADVANCED or use ANY bottled tears, none, not any, we mean it. No bottles!!
   ✓ Use only one drop at a time and wait 5 minutes between different drops, otherwise the second drop will just wash the first one away.

2. Step Two- Protect your eyes and keep them comfortable!
   ✓ Lean back while putting in your drops. Gently close your eyes, and take care not to blink your bandage contact off. DO NOT rub your eyes!
   ✓ Wear the protective goggles the first week at night/during naps.
   ✓ For the first week, don’t get dust, dirt or smoke in the eyes, and no eye makeup.
   ✓ Do not exercise where you could perspire, don’t get in a hot tub or sauna.
   ✓ You can shower normally, just keep the soap out of your eyes.
   ✓ Don’t swim for 3 weeks.
   ✓ Keep up with the Motrin. Drops in the fridge, walks in the cold and cold compresses help. Take Vicodin if needed. Motrin and Vicodin can be taken together.

3. Step Three- Follow up with your eye doctor
   ✓ Your first visit is early the next morning after your procedure. Other visits are at one week, one month and 10 weeks. Make sure to continue vitamin C for 6 months.
   ✓ **VERY IMPORTANT:** If the contact comes out, DO NOT put it back in, call us and we will decide if need to see you. Your vision does get somewhat worse on Sunday/Monday (day 3 or 4) as the edges heal together. Call us immediately for worsening pain and light sensitivity past Sunday/Monday.
Common Questions

Q. What's the best advice you can give someone after his or her PRK surgery?
A. A positive mental outlook will help you heal better and adapt to the normal fluctuations in vision that everyone experiences. Your vision continues to improve for several months with PRK. Enjoy your vision and make comparisons to how you were seeing without lenses prior to your PRK surgery.

Q. Why does my vision blur at the end of the day or when I've been reading and using the computer for awhile?
A. Dryness and decreased blinking can blur your vision for up to six months after your PRK surgery. Your eyes may not even feel dry, but often they are. Force yourself to blink more frequently and use your artificial tears (Refresh, Refresh Plus, Refresh Optive, Systane Ultra, or Theratears) frequently. Tears not only make them feel better, but additionally will help you see and heal better. Taking FLAX seed oil orally often can improve the moisture to your eyes (available at health food stores).

Q. Why is it harder to read now?
A. Most people are a little over-corrected at first, making your near vision worse for about a month. If you are over forty something you’ll need reading lenses at least part of the time. You may want to use “dime-store” readers/magnifiers until you have healed enough to get prescription readers.

Q. Why is my vision worse at night?
A. Glare and a loss of contrast in dim conditions is a normal part of the healing process. After about 10 weeks, this starts to fade. If you are struggling with your night vision let your doctor know. There are some drops that can help.

Q. How will I know if I’m going to need an enhancement or touch up?
A. Many people continue to heal for several weeks after their surgery. Your doctor will normally wait for 3 months for your vision to stabilize before doing an enhancement. A good rule of thumb is this: If you’re seeing well, you don’t need an enhancement. Remember, “perfect vision” at all times is an unrealistic goal and seldom obtainable. Your goal is to see well enough to function without lenses for most distance activities.

Q. Why are my eyes still irritated and dry and my eyelashes have a lot of crusting?
A. You may have a low grade infection of the eyelash margin. Use a warm wash cloth and gently scrub your lashes to clean them morning and night. Cleaning the lashes off will allow your tears to work better and you’ll see more clearly too.
